

# QuickIM

**wireless**  
**instant**  
**messaging service is about**  
**always staying in touch**

phone design - julien tromeur - 2003

MIDP 2.0 compatible  
PalmOS compatible  
BlackBerry compatible

Fits in less 100kb of Memory

Plug-n-play GUIs for more or less advanced phones

Compatible with a maximum number of phones (screen size and color depth independent)

All messages are stored in a separate language resource file, so the software can be localized easily

Instant messaging applications are today one of the most popular forms of wired communication. Over 1 billion wireless devices are on the market and it has been forecasted that very soon more people will be accessing the Internet from a mobile device than from a wired device.

Therefore, it is important to offer a global service so that anybody can communicate using Instant Messaging (IM) services whatever the device used (PC, laptop, mobile phone, PDA, etc.) in an interoperable manner.

*QuickIM™* combines the popularity of the PC based programs with the ever-increasing availability and usage of the wireless messaging market. It provides a user-friendly environment for mobile users, almost identical to that of online instant messaging, differing only in the fact that PC based instant messaging communities will have access to wireless users. This allows desktop users and mobile users to interact and communicate via instant messages in a seamless and fully interoperable wireless instant messaging platform.

**Whatever  
The  
Reason...**

**Whatever  
The  
Device...**
